ABSTRACT

Slagsvold, Tore 1977. Bird song activity in relation to breeding cycle, spring weather and environmental phenology - statistical data.

K. norske Vidensk. Selsk. Mus. Rapport Zool. Ser. 1977-12.

Tables are given showing basic results from correlation and linear regression analysis between various song activity variables themselves and relationships with spring weather and phenophases of the environment; localities in South Norway 1968-74.

*Tore Slagsvold, Zoological Institute, University of Trondheim,
Rosenborg, 7000 Trondheim, Norway.*

INTRODUCTION

Seasonal variation in song activity of forest bird species in South Norway was studied in 1968-74. The present paper gives basic results from correlation and linear regression analysis between the song activity variables themselves and relationships with spring weather and phenophases of the environment. Conclusions drawn and further discussion of the tables are given by Slagsvold (1977).

DEFINITIONS AND ABBREVIATIONS

R	the plot at Røa
S	the plots in Sørkedal
T	the plots at Trondheim (Tiller and Bratsberg)
V	the plots in Valdres
M1	the date of the first maximum of song activity
M2	the date of the second maximum of song activity
MIN	the date of the minimum of song activity during the period between M1 and M2
F30, F60	the date when the graph reaches 30% and 60%, respectively, of the value obtained at M1 for the first time
L60, L30	the date when the graph has a value that corresponds to 60% and 30%, respectively, of the value obtained at M1 for the last time
M $2^{\circ}\sigma/M1^{\circ}\sigma$	the size of M2 in proportion to the size at M1
MIN $\sigma/M1^{\circ}\sigma$	the size of MIN in proportion to the size at M1
B20, B80	the date when 20% and 80%, respectively, of the plot is free from snow in spring
BUD	the mean date on which the tips of the birch leaves protrude 2 mm beyond the bud scales
BP	the mean date on which the petioles of the birch leaves are visible for the first time in spring
LEAFING	the mean date on which the birch leaves attain 75% of their final length (cf. Slagsvold 1976a)
Stage 0.58 of <i>Oncopsis</i>	the date on which the mean breadth of the carapace (vertex) measured across the eyes reaches 0.58 mm
Stage 1-2 of <i>M. morio</i>	the date on which the femur length of <i>Mitopus morio</i> attains the mean for the juveniles stages 1 and 2
r	simple correlation coefficient
n	sample size
Fix date r	the r value for a relationship in which the temperature or precipitation recorded over a certain period, terminating on a fixed date, forms the independent variable (cf. Slagsvold 1976b)

Critr

the highest r (absolute) value obtained for temperature or precipitation as the independent variable, for periods of varying length for which the starting and termination dates were tested (cf. Slagsvold 1975a and b).

Table I. Correlation coefficients for the relationship between certain song variables and the time of the first song peak (M1). Significant values shown in italics. (For key see DEFINITIONS AND ABBREVIATIONS.)

Table II. Regression coefficients between song variables and start of growth by *Mitopus morio*. Significant values shown in italics. For the date of the first song maximum the whole regression equation is given. The dates refer to a baseline of March 1 = 1. n is the number of records used in the regression, excepting those in the two right-hand columns, viz. n = 5-16 for LEAFING and n = 5-11 for Stage 1-2 of *M. morio*. (For key see DEFINITIONS AND ABBREVIATIONS.)

Table VI. Correlation coefficients obtained between the dates of song variables and temperature and precipitation during two periods in spring, for each species (all plots and years, 1968-74). The periods were all of 30 days duration, terminating on the mean date of M1 and the mean date of the song variable, respectively. Significant values are shown in italics. (For key see DEFINITIONS AND ABBREVIATIONS.)

Table VIII. Mean air temperature ($^{\circ}\text{C}$), with range at M₁ in brackets, for the morning and evening surveys and for the survey that preceded M₁ and for that which followed immediately afterwards, all for the bird community. Only the plots have been used for which the surveys were carried out (and temperature measured) at the same fixed intervals in relation to sunrise and sunset (see Slagsvold 1973).

Area	Morning surveys			Evening surveys				
	n	Before	At M ₁	After	n	Before	At M ₁	After
R	2	1.7	5.1(3.6-6.6)	5.4	2	3.9	15.1(14.6-15.5)	15.3
S	6	3.2	4.2(1.9-6.8)	5.3	8	9.6	10.7(8.3-12.8)	9.0
T	4	2.4	5.1(3.4-7.3)	2.0	4	5.1	9.3(7.4-12.8)	7.2
V	2	2.7	3.4(2.5-4.2)	9.3	4	4.9	8.2(5.8-12.5)	6.9
Total	14	2.7	4.5(1.9-7.3)	4.9	18	6.9**	10.3(5.8-15.5)	8.8*

Significantly different from the value at M₁, * $P \leq 0.05$ ** $P \leq 0.01$.
