Contents

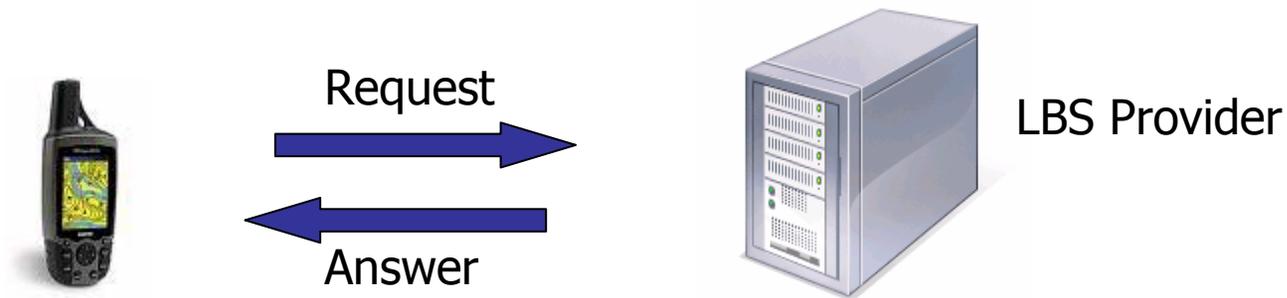

- Location privacy in LBS
- The privacy attack
- The privacy-preserving strategy
- Conclusions and future plans

The LBS context

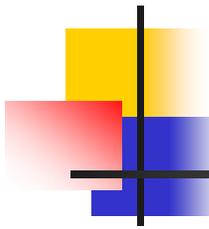

LBS is becoming a key application area under the push of GPS-enabled handset providers, novel satellite navigation systems and special events

Location privacy in LBS

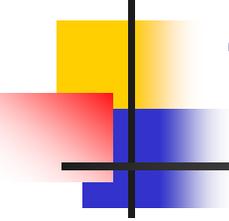

Request: [U345, "Where is the closest ATM" , (long, lat)]

- Accurate position information is sensitive, LBS providers are not fully trustworthy
- The location privacy issue: how to prevent the communication of the association user-position (Beresford & al. 2003)
- Focus of this work: preventing the disclosure of a user's position in a place which is sensitive for this user, e.g. a hospital

Location privacy-preserving techniques

- **Location k-anonymization** (Gruteser03, Gedik05, Mokbel06, Kalnis07)
 - The goal is to make the request anonymous. Yet, the user's location is a quasi-identifier
 - The location is thus generalized, i.e. it is made undistinguishable from the location of other $k-1$ users
- **Location obfuscation** (Atallah04, Duckam05, Cheng06, Ardagna07, Yiu08)
 - The goal is to provide correct answers to LBS queries without knowing the position of the user
 - The client transmits a coarse or fake position along with the query; the LBS provider sends back a set of possible solutions; the client selects among the set of candidates the most suitable

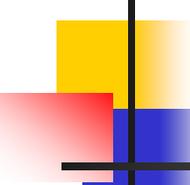

The spatial knowledge attack

- Current methods typically consider position from a geometric viewpoint while, conversely, position may have also a meaning
 - A point of coordinates (x_0, y_0) vs. to be in a hospital
- Current techniques are unable to protect against the inferences made by linking the geometric information with the location meaning, that, depending on the user, may represent sensitive information

Example

4-anonymous location

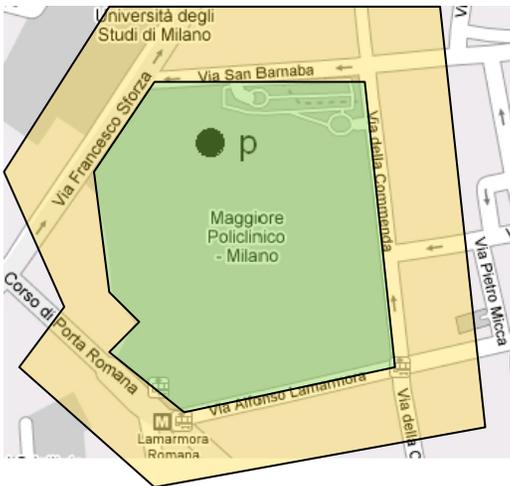

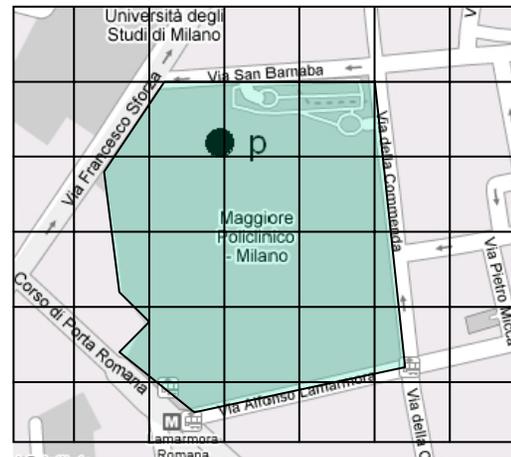

Outline of the privacy-preserving strategy

- A user specifies preferences about sensitive places and the desired degree of privacy
- The location obfuscation process is applied
 - Step 1) Off-line: obfuscated locations generation
 - For each sensitive place a coarse location is generated
 - Step 2) At run-time: obfuscation enforcement
 - The user's position p is matched against the set of obfuscated locations. If p is contained in any obfuscated location L then L is transmitted to the LBS provider
- An adversary who only knows the obfuscated location may only infer that the user *may be* in a sensitive place

The obfuscation of regions

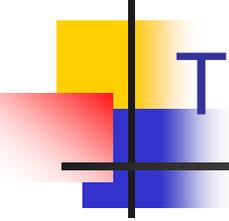

A naive approach

Each cell is assigned a sensitivity value

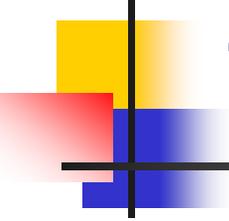

Each cell is obfuscated separately

Obfuscation is obtained by merging adjacent cells, until the desired degree of privacy is possibly obtained

The specification of privacy preferences

- Model of space
 - Sensitive and unreachable location classes
 - *Sensitive* locations classes: Religious Buildings
 - *Unreachable* locations classes: Military Zones
- Sensitivity metric
 - One of the possible metrics:
 - Each class of sensitive locations is assigned a score
 - $SL(r) = \sum_{ft \in FT_S} \text{Score}(ft) \cdot \text{Area}_{\text{Fea}}(r, ft) / \text{Area}_{\text{Reg}}(r)$
- Sensitivity threshold θ_{Sen}
 - Specifies the maximum sensitivity tolerated by the user
 - $\forall r \text{ } SL(r) \leq \theta_{\text{Sen}}$

The obfuscation algorithm: issues

- 1) How to represent and how to aggregate the cells?
 - Regions are represented as nodes of a graph (RAG - Region Adjacency Graph). Arcs connect adjacent regions.
 - Cells are merged and larger regions are obtained by shrinking the graph
- 2) On which data can we evaluate the algorithm?
 - Available data sets describe locations at low resolution. A generator of synthetic data has been developed for the population of areal sensitive place

Experimenting with synthetic data

| | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|
| 1 | 1 | 3 | 3 | 4 | 15 | 6 | 7 | 8 | 9 |
| 10 | 11 | 11 | 23 | 23 | 15 | 16 | 7 | 18 | 19 |
| 20 | 21 | 22 | 23 | 24 | 25 | 26 | 27 | 28 | 29 |
| 30 | 41 | 32 | 33 | 34 | 34 | 36 | 37 | 38 | 39 |
| 40 | 41 | 42 | 44 | 44 | 55 | 46 | 47 | 48 | 49 |
| 50 | 51 | 52 | 53 | 64 | 55 | 66 | 57 | 69 | 69 |
| 60 | 61 | 62 | 63 | 64 | 65 | 66 | 67 | 68 | 69 |
| 80 | 71 | 72 | 73 | 74 | 74 | 76 | 87 | 79 | 79 |
| 80 | 81 | 82 | 83 | 84 | 84 | 76 | 87 | 88 | 89 |
| 90 | 90 | 92 | 93 | 94 | 96 | 96 | 97 | 98 | 99 |

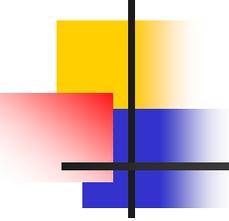

$\theta_{sens} = 0.5$

| | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|
| 1 | 1 | 3 | 3 | 23 | 23 | 6 | 7 | 8 | 9 |
| 10 | 11 | 11 | 23 | 23 | 15 | 16 | 7 | 18 | 29 |
| 10 | 21 | 22 | 23 | 24 | 15 | 26 | 27 | 28 | 29 |
| 30 | 41 | 33 | 33 | 34 | 34 | 36 | 37 | 49 | 49 |
| 40 | 41 | 42 | 44 | 44 | 55 | 46 | 47 | 59 | 49 |
| 51 | 51 | 53 | 53 | 64 | 55 | 74 | 57 | 59 | 59 |
| 80 | 61 | 62 | 63 | 64 | 74 | 74 | 67 | 69 | 69 |
| 80 | 71 | 71 | 73 | 74 | 74 | 76 | 87 | 69 | 79 |
| 80 | 90 | 90 | 83 | 84 | 84 | 76 | 87 | 69 | 79 |
| 90 | 90 | 92 | 93 | 94 | 96 | 96 | 97 | 69 | 79 |

$\theta_{sens} = 0.4$

| | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|
| 11 | 11 | 11 | 11 | 23 | 23 | 23 | 7 | 8 | 9 |
| 11 | 11 | 11 | 23 | 23 | 23 | 16 | 7 | 69 | 29 |
| 11 | 11 | 22 | 23 | 23 | 23 | 23 | 27 | 69 | 29 |
| 11 | 11 | 11 | 11 | 34 | 34 | 23 | 23 | 69 | 69 |
| 11 | 11 | 11 | 44 | 44 | 55 | 46 | 23 | 69 | 69 |
| 80 | 80 | 11 | 74 | 74 | 55 | 23 | 23 | 69 | 69 |
| 80 | 61 | 74 | 74 | 74 | 74 | 23 | 23 | 69 | 69 |
| 80 | 80 | 80 | 74 | 74 | 76 | 76 | 23 | 69 | 79 |
| 80 | 90 | 90 | 83 | 76 | 76 | 87 | 87 | 98 | 79 |
| 90 | 90 | 90 | 90 | 94 | 96 | 96 | 96 | 98 | 79 |

$\theta_{sens} = 0.3$

Final remarks and future plans

- We have identified and then proposed an approach to contrast the spatial knowledge attack under the assumption that all positions in space are equally probable
- Focus on: privacy model, obfuscation algorithm
- Open issues:
 - Generalization to non-uniform distribution of positions
 - Evaluation of more intuitive sensitivity metrics
 - Evaluation of different heuristics, to ensure a scalable solution
 - Protection from additional context-based inferences
