Lecture 4: Stationary magnetic field

- Magnetic field
- Gauss’s law
- Ampere’s law
- Magnetic field in material
Magnetic field

**Charges in motion (currents) produce magnetic field**

**Magnetic field** $\mathbf{H}$ in vacuum generated by moving charge $q$:

$$H = \frac{1}{4\pi} \frac{qv \times \hat{r}}{r^2}$$

Independent of material property

**Magnetic flux density** $\mathbf{B}$ in vacuum generated by moving charge $q$:

$$\mathbf{B} = \frac{\mu_0}{4\pi} \frac{qv \times \hat{r}}{r^2}$$

$n$ is perpendicular to the plane containing $\mathbf{v}$ and $\mathbf{r}$, in the direction given by the right-hand rule

$$\mathbf{v} \times \mathbf{r} = |v| \sin(\theta) \mathbf{n}$$

$\mu$ is called permeability and material dependent, in free space is $\mu_0 = 4\pi \times 10^{-7} \text{H/m}$. 

$\mathbf{B} = \mu_0 \mathbf{H}$
Magnetic (Lorentz) force

Force exerted by magnetic field $\mathbf{B}$ on a moving point charge $Q$ is:

$$\mathbf{F} = Q \mathbf{v} \times \mathbf{B}$$

Comparing to $\mathbf{F}_c$

Lorentz law  \quad \text{Coulomb’s law}

Magnetic force acting on a moving charge is always perpendicular to it’s moving direction, so magnetic force only changes the charges’ moving direction.

$$W = F \cdot L = \int F \cdot d\mathbf{l} = \int F \cdot \mathbf{v} \, dt$$

Work is application of force, $\mathbf{F}$, to move an object over a distance, $L$, in the direction that the force is applied.
Lorentz law

Force exerted by magnetic field $\mathbf{B}$ on a moving point charge $Q$ is:

$$\mathbf{F} = Q \mathbf{v} \times \mathbf{B}$$

The direction is given by the right-hand rule.

Lorentz law

$$\mathbf{F} = q\mathbf{E} + q(\mathbf{v} \times \mathbf{B})$$
Example: Point charge’s movement in constant uniform magnetic field

A constant uniform magnetic field $\mathbf{B}$, a charge $q$ with mass $m$ is shot perpendicularly to the magnetic field with speed $\mathbf{V}(0)$, what is the radius of charge?

Centrifugal force

$$ F = \frac{mv^2}{r} = qvB\sin\theta \quad (\theta \text{ is the angle between } \mathbf{v} \text{ and } \mathbf{B}, 90^\circ) $$

$$ r = \frac{mv^2}{qvB} = \frac{mv}{qB} $$

https://www.youtube.com/watch?v=orsMYomjwIw

What happens if $\theta$ is not 90$^\circ$?
Electric motor

It produces mechanical energy by **current and magnets**

Rotating windings: electric current (moving charge) flows
Biot-Savart law: Magnetic field generated by current

The Biot–Savart law is used for computing the resultant magnetic field $\mathbf{B}$ at position $\mathbf{r}$ in 3D-space generated by a steady current $I$.

\[
\mathbf{H}(\mathbf{r}) = \int_c \frac{l'(r)dl' \times \hat{R}}{4\pi R^2}
\]

\[
\mathbf{B}(\mathbf{r}) = \int_c \frac{\mu_0 l'(r)dl' \times \hat{R}}{4\pi R^2}
\]

\[l'dl' \times \hat{R} = |l'|dl' \sin(\phi) \mathbf{n}\]

$\mathbf{n}$ is perpendicular to the plane containing $l'$ and $\hat{R}$, in the direction given by the right-hand rule

Scalar calculation

\[
\mathbf{H}(\mathbf{r}) = \frac{1}{4\pi} \int_c \frac{l'(r)dl' \sin\phi}{R^2}
\]

\[
\mathbf{B}(\mathbf{r}) = \frac{\mu_0}{4\pi} \int_c \frac{l'(r)dl' \sin\phi}{R^2}
\]
Example: Magnetic flux density

Find the magnetic field \( B \) at a point \( P \) at perpendicular distance \( r \) from the center of a finite length of current \( I \), the total current length is \( 2a \).

\[
\begin{align*}
\frac{dB}{dB} &= \frac{\mu_0 I dl \times \hat{R}}{4\pi R^2} \\
B &= \int_{-a}^{a} \mu_0 \frac{I dz}{4\pi R^2} \hat{R} = \int_{-a}^{a} \mu_0 \frac{I dz}{4\pi R^2} \hat{R} = \int_{-a}^{a} \frac{\mu_0 I \sin \phi dz}{4\pi R^2} \\
\sin(\phi) &= \frac{r}{\sqrt{r^2 + z^2}} \\
R^2 &= r^2 + z^2 \\
B &= \int_{-a}^{a} \frac{\mu_0 I \sin \phi dz}{4\pi R^2} = \frac{\mu_0 I \ln}{4\pi} \int_{-a}^{a} \frac{dz}{(r^2 + z^2)^{3/2}} = \frac{\mu_0 I}{2\pi r} \frac{a}{(r^2 + a^2)^{1/2}} \\
\end{align*}
\]

Assuming \( a \gg r \), what is \( B \)?

\[ B = \frac{\mu_0 I}{2\pi r} \]
Example: Magnetic flux density

\[ \frac{z}{r} = \tan(u) \quad \text{and} \quad dz = \frac{r du}{\cos^2(u)} \]

\[
A = \int \frac{dz}{(r^2 + z^2)^{3/2}} = \int \frac{dz}{(r^2 + z^2)^{3/2}} = \int \frac{dz}{(r^2 + r^2 \tan^2(u))^{3/2}} = \int \frac{1}{(r^2 + r^2 \tan^2(u))^{3/2}} \frac{r du}{\cos^2(u)} = \\
\int \frac{1}{r^3(1 + \tan^2(u))^{3/2}} \frac{r du}{\cos^2(u)} = \int \frac{1}{r^2(\cos^2(u) + \sin^2(u))^{3/2}} \frac{du}{\cos^2(u)} = \int \frac{\cos(u)}{r^2(1)^{3/2}} du = \int \frac{\cos(u)}{r^2} du = \\
\frac{\sin(u)}{r^2} + c = \frac{z}{r^2(r^2 + z^2)^{1/2}} + c
\]

\[
B = \frac{\mu_0 l r}{4\pi} A = \frac{\mu_0 l r}{4\pi} \int_{-a}^{a} \frac{dz}{(r^2 + z^2)^{3/2}} = \frac{\mu_0 l}{2\pi r} \frac{a}{(r^2 + a^2)^{1/2}}
\]
Example: Field on axis of circular loop

A ring with radius $a$ and current $I$, calculate $B$ at point on the $z$ axis.

$$dB \cdot \hat{z} = dB \cos \beta = dB \sin \alpha,$$

$B$ and $dB$ directions are different

$$dB = \frac{\mu_0 I dl \times \hat{R}}{4\pi R^2} \quad dB = \frac{\mu_0 I dl}{4\pi R^2}.$$

$$B = \int_{\text{ring}} dB \sin \alpha = \frac{\mu_0 I \sin \alpha}{4\pi R^2} \int dl = \frac{\mu_0 I \sin \alpha(2\pi a)}{4\pi R^2} = \frac{\mu_0 I a^2}{2R^3}$$

$R = \sqrt{z^2 + a^2}$

$$B = \frac{\mu_0 I a^2}{2R^3} \hat{z} = \frac{\mu_0 I a^2}{2(z^2 + a^2)^{3/2}} \hat{z}$$

$\sin \alpha = \frac{a}{R}$
Magnetic flux and Gauss’s law

Magnetic flux \( \phi \) is the integral of the flux density across surface

\[
\phi = \int_S \mathbf{B} \cdot d\mathbf{S}
\]

For an enclosed surface, the flux is zero

\[
\int_S \mathbf{B} \cdot d\mathbf{S} = 0.
\]

Gauss’s law \( \nabla \cdot \mathbf{B} = 0 \)

There is no magnetic monopole.

\[
\oint_S \mathbf{A} \cdot d\mathbf{S} = \int_v \nabla \cdot \mathbf{A} dv = 0
\]
**Ampere’s law**

Ampere's Law states that for any closed loop $C$, the line integral of the magnetic field around closed loop $C$ is equal to the electric current enclosed in the loop.

\[ \oint_C \mathbf{H} \cdot d\mathbf{l} = \int_S \mathbf{J} \cdot d\mathbf{s} = I \]

Current generates magnetic field

\[ \oint_C \mathbf{B} \cdot d\mathbf{l} = \int_S \nabla \times \mathbf{B} \cdot d\mathbf{S} = \mu_0 \int_S \mathbf{J} \cdot d\mathbf{S}. \]

Stokes’ theorem

\[ \nabla \times \mathbf{B} = \mu_0 \mathbf{J}, \]

\[ \frac{1}{\mu_0} \nabla \times \mathbf{B} = \nabla \times \mathbf{H} = J \]

\[ \nabla \times \mathbf{H} = \frac{\partial \mathbf{D}}{\partial t} + \mathbf{J} \]

In magnetostatic, such as constant DC current, \( \frac{\partial \mathbf{D}}{\partial t} = 0 \)
Ampere’s law: Describing the magnetic field around a current

Stokes’ theorem:
\[ \int_{\partial \Sigma} \mathbf{B} \cdot d\mathbf{l} = \oint_{\Sigma} \nabla \times \mathbf{B} \cdot d\mathbf{S} \]

\[ \int_S \nabla \times \mathbf{B} \cdot d\mathbf{S} = \oint \mathbf{B} \cdot d\mathbf{l} = 2\pi r B(r) \]

\[ \int_S \nabla \times \mathbf{B} \cdot d\mathbf{S} = \int_s \mu_0 I \cdot d\mathbf{S} = \mu_0 I \]

\[ \nabla \times \mathbf{B} = \mu_0 \mathbf{J} \]

\[ 2\pi r B(r) = \mu_0 I \quad \Rightarrow \quad B(r) = \frac{\mu_0 I}{2\pi r} \]
Magnetic field for solenoid

\[
\int_S \nabla \times \mathbf{H} \cdot d\mathbf{S} = \oint \mathbf{H} \cdot d\mathbf{l} = Hl
\]

\[
\int_S \nabla \times \mathbf{H} \cdot d\mathbf{S} = \int_S \mathbf{J} \cdot d\mathbf{S} = NI
\]

\[B = \mu H\]

If the core is iron instead of air, the flux density \( B \) is much stronger.
Example

https://www.space.com/earths-magnetic-field-explained
Example: Magnetic field

A coaxial line carrying current $I$ on the inner conductor and $-I$ on the outer. Calculate the magnetic field $H$ at $r$ distance, current evenly distributed in the two conductors.

1) $0 < r < a$

$$H_{\phi}(r) = \frac{I(r)}{2\pi r} = \frac{Ir}{2\pi a^2} \quad (0 < r < a)$$

$$H_{\phi} = \frac{I}{2\pi r} \quad (a < r < b)$$

$$B(r) = \frac{\mu_0 I}{2\pi r}$$
Magnetic field in material

Once there is magnetic field applied to medium, the electronic spin motions in the atoms can be thought of as circulating current that produces a field $\mathbf{M}$, magnetization.

$$ \mathbf{B} = \mu_0 (\mathbf{H} + \mathbf{M}) $$

$$ \mathbf{M} = \chi_m \mathbf{H} $$

$$ \mathbf{B} = \mu_0 (1 + \chi_m) \mathbf{H} = \mu_0 \mu_r \mathbf{H} = \mu \mathbf{H} $$

$\chi_m$ is magnetic susceptibility, used to quantify the additional field $\mathbf{M}$.

$\mu_r$, relative permeability.

Magnetization increases the magnetic flux density $\mathbf{B}$ in ferro-magnetic materials compared to vacuum.

Good magnetic material relative permeability
Iron: $\sim 5000$

Bad magnetic material relative permeability
Silver: 1
Copper: 1
Gold: 1
Aluminium: 1
Field in magnetic material

Magnetic material can be used to guide magnetic field path.
Permanent magnet

For some materials, after magnetization the electron movement can remain when external magnetic field disappears. The electron movement can be distorted at high temperatures, strong opposite external field or strong shock.
Hysteresis loop

The hysteresis loop shows the "history dependent" nature of magnetization of a ferromagnetic material. Once the material has been driven to saturation, the magnetizing field can then be dropped to zero and the material will retain most of its magnetization (it remembers its history).

When driving magnetic field drops to zero, the ferromagnetic material retains a considerable degree of magnetization. This is useful as a magnetic memory device.

The driving magnetic field must be reversed and increased to a large value to drive the magnetization to zero again.

Materials magnetized to saturation are aligned by the domains.

The material follows a non-linear magnetization curve when magnetized from a zero field value.

Toward saturation in the opposite direction.
Hysteresis loop

a. For permanent magnet, the material should have a large HL to gain high remanence and coercive force.

b. For electro-magnet, high permeability and low coercivity are required.
Magnetic circuit

Magnetomotive force (MMF): \( F = NI = HL = \Phi R \)

\( \Phi \), magnetic flux
\( R = \frac{l}{\mu S} \), magnetic reluctance

- The magnet \((HL)\) or current \((NI)\) possesses a magneto-motive force \((MMF)\).
- The MMF generates a magnetic flux.
- The enclosed flux path is called a magnetic circuit.
- A stronger MMF produces more flux.
- The lower the reluctance, the more the flux.

Boundary condition for static magnetic field

**Normal component**
\[ \oint \mathbf{B} \cdot d\mathbf{S} = 0 \]
\[ B_{n1}\Delta S - B_{n2}\Delta S = 0 \]
\[ B_{n1} = B_{n2} \]

**Tangential component**
\[ \oint \mathbf{H} \cdot d\mathbf{l} = H_{t1}\Delta l - H_{t2}\Delta l = J_s\Delta l \]
\[ H_{t1} - H_{t2} = J_s \]

**Line current density**
\[ \oint_C \mathbf{B} \cdot d\mathbf{l} = \int_S \nabla \times \mathbf{B} \cdot d\mathbf{S} = \mu_0 \int_S \mathbf{J} \cdot d\mathbf{S}. \]
